

# Datalogging To The Internet

## System Overview

The Advanced Information Networks provides a Machine-To-Web Portal that allows remote devices to send logged data to the Internet.

## Online Demonstration

Visit the online demonstration of Machine-To-Web Technology at: [www.advancedinformation.net/sms\\_solutions.html](http://www.advancedinformation.net/sms_solutions.html). In this demo the XE-8000 SMS Controller logs the local temperature on an hourly basis. It periodically sends this data to the Machine-To-Web Portal where it is displayed on the Advance Information Networks web site.

## System Administration

Using a PC, the System Administrator manages the configuration of the XE-8000 SMS Controller from the Client Area of the Advanced Information Networks web site.

This is where the logged data can be downloaded or viewed.

## Data Access by Other Users

In many applications, other users must also be able to view the logged data.

- System Administrator
- Technicians
- Management
- Auditors
- Clients

The System Administrator can create Data Access accounts that allow other users to log into the Client Area to view the logged data of the SMS Controller. When the other users log into the Client Area they can not see or change the system configuration.
